

# AUSTIN STICKLEY

AI Product Engineer · Full-Stack Builder

Toledo, OH (open to relocation / remote) · 567-694-2214 · [ams@stickleyai.com](mailto:ams@stickleyai.com)

[austinstickley.dev](http://austinstickley.dev) · [github.com/astickleyid](https://github.com/astickleyid)

## SUMMARY

---

Self-taught product engineer who designs and ships complete software products end-to-end — architecture, data modeling, frontend, backend, AI integration, billing, and deployment. Working with LLMs as a primary execution layer since 2023, building memory-persistent, multi-step agent workflows on GPT-3 before agent frameworks or tooling existed. Shipped 15+ production-deployed applications solo across web, mobile, and games. Strongest in translating an ambiguous problem into a complete technical specification and driving it to a live, working product.

## TECHNICAL SKILLS

---

**Languages & Runtimes** TypeScript, JavaScript, Python, Swift, Node.js, SQL

**Frontend** React 19, Next.js 14/15, Vite, Tailwind CSS, SwiftUI, Framer Motion, design systems

**Backend & Data** Supabase (Postgres), Upstash Redis, Cloudflare D1/R2/Workers, REST API design, session auth, webhooks

**AI & Agents** Anthropic Claude API, OpenAI API, MCP server development, multi-agent orchestration, prompt & spec engineering, local LLMs (Ollama, Phi-3, Llama 3), cost-tiered model routing

**Graphics & Realtime** Babylon.js, Three.js, WebGL, Web Audio API, WebRTC, TensorFlow.js

**Infrastructure** Vercel, Cloudflare, GitHub Actions, Git, Stripe, Resend, Twilio, Playwright, Linux VPS

## EXPERIENCE

---

### Founder & Product Engineer — Stickley AI (independent studio)

2023 – Present · Toledo, OH

Solo-operated product studio. Own every layer of each product: problem framing, technical specification, system architecture, implementation, security review, deployment, and maintenance.

- Architected and shipped **15+ production applications** across AI SaaS, CRM, AR, developer tooling, and games — each independently specified, built, and deployed.
- Built a **7-agent autonomous system** for local-business website production, including **5 custom MCP servers**, a Next.js 15 operator dashboard, and mobile approval workflows — an orchestration layer where specialized agents own discrete stages of a production pipeline.
- Built agentic workflows on **GPT-3 in 2023** — persistent memory, scoped skills, and multi-step task decomposition — anticipating patterns that later became standard in agent frameworks.
- Practice **spec-first engineering**: every product begins with a complete written specification covering screens, data models, API surface, edge cases, and milestones before implementation begins.
- Perform **production incident diagnosis**: traced a full AI-feature outage to a hardcoded, retired model identifier rather than the assumed billing failure, shipped the fix, and moved model IDs to environment variables to prevent silent recurrence.
- Apply **cost engineering** to LLM systems — routed high-volume structured tasks to a cheaper, faster model tier while reserving the flagship model for customer-facing generation, cutting per-call cost roughly 5x on those paths.
- Own **security and dependency hygiene**: patch advisories, separate production from dev-only exposure, and document risk-accepted deferrals where a major-version upgrade outweighs a low-severity issue.

### Founder — Grasslane Lawn Co.

2026 – Present · Toledo, OH

Founded and operate a local lawn care business. Direct operational exposure to how small trade businesses actually run — scheduling, quoting, invoicing, and customer follow-up — which became the primary domain research behind Fieldline.

## SELECTED PROJECTS

---

### Fieldline — AI-Native CRM for Trade Businesses

*Next.js 14 · TypeScript · Upstash Redis · Anthropic API · Resend · iron-session*

Full-featured contractor CRM: leads, customers, calendar, job mapping, invoicing, tasks, reviews, automations, and analytics, with public invoice views and web booking. AI layer handles quote generation, price suggestion, lead scoring, follow-up drafting, and review replies. Implemented trade-aware demo seeding so each new signup receives a realistic, industry-matched dataset. Live and functional end-to-end.

### maps-agency — Multi-Agent Production System

*Next.js 15 · MCP servers · multi-agent orchestration*

Seven-agent system that autonomously produces local business websites, coordinated through five purpose-built MCP servers with human approval gates delivered to mobile. Designed as a distribution engine rather than a point product.

### Zone Strike / VOID RIFT — Browser & iOS Games

*Babylon.js 9 · TypeScript · Vite · Web Audio · SwiftUI · Game Center*

Browser FPS built without a game engine: first-person controller, hitscan combat, bot AI, capturable zone scoring, procedural WebAudio SFX, and full health/death/respawn systems. Companion iOS title with Game Center leaderboards, a hybrid progression schema (account-wide ability ownership with per-ship loadouts), and an App Store marketing asset pipeline generated via Playwright.

### AURA — Real-Time Augmented Reality Platform

*TensorFlow.js (COCO-SSD) · WebRTC · TomTom Traffic API · PulsePoint*

Browser-based AR platform performing live in-browser object detection over a camera feed, layered with real-time traffic and emergency-response data streams.

### KeyBridge — API Key Management

*Next.js · Supabase · Upstash · Stripe · Anthropic API*

Universal API key management service with full subscription billing, a security-first data model, and a deliberate brutalist terminal aesthetic.

### ReputationAgent — Autonomous Review Management

*Agent-as-a-service architecture*

Autonomous AI agent managing online reviews for local service businesses. Built through a seven-gate development process to 42/42 passing tests and a clean production build.

### austinstickley.dev — Portfolio Platform

*React · Vite · Framer Motion*

Engineering portfolio with live embedded previews of deployed products, per-project case studies documenting problem, architecture, and tradeoffs, lazy-loaded iframes via IntersectionObserver, and a full SEO implementation (JSON-LD, sitemap, llms.txt, dynamic OG assets).

## EDUCATION

---

### High School Diploma

Self-taught in software engineering, systems architecture, and applied AI. Every technology listed above was learned by building and shipping production software with it.

## ADDITIONAL

---

- Operate local LLM deployments (Ollama, Phi-3, Llama 3) to prototype multi-agent workflows before committing to paid inference.
- Publish an independent AI news outlet at voidnews.org.
- Open to relocation for the right opportunity.
